## Online Register of Deeds System

Inttek's Web ROD™ - Online Register of Deeds System is an Internet based solution for management / public access of Register of Deeds information, and documents.

Web ROD™ was designed with one goal in mind – provide the most comprehensive, easy to use, reliable, and cost effective Register of Deeds solution available. **The goal has been reached!**

See for yourself, visit <http://WebROD.inttek.net> for a live demonstration.

## Web ROD™ System Details:

Inttek is a leader in Internet based software technologies with a 6-year track record of providing Enterprise Class Solutions for Industry. Inttek has developed several lines of web based supply chain and inventory management systems, EDI communication

### Key Inttek and Software Features

- Over 6 years industry and corporate experience developing Internet Software – proven track record, with guaranteed results.
- Working Register of Deeds System in place – references available from NC Register of Deeds and MIS Departments. We are familiar with your needs and NC legal requirements for documentation.
- Mission critical reliability, speed, and efficiency - and most importantly - ease of use.
- Images of documents can be viewed from a standard web browser, without any additional software. The system is designed to be accessed over traditional dial-up Internet connections, allowing users excellent performance, and quick downloads. This combination results in satisfied end users.
- Ultra-fast document searching and retrieval displayed in an easy to use format. Search technology

technologies, and advanced image-processing software. Inttek's Register of Deeds system inherits our extensive corporate background and experience. Mission critical reliability, speed, efficiency - and most importantly - ease of use, are the cornerstones of our solutions.

Ease of use, for both the online visitor, and for system administration, is a critical factor. Experience has taught us the biggest challenge to implementation of systems typically is end user training and utilization. User acceptance depends on the ability for people to quickly and intuitively understand how to use the system. The user interface design applies our knowledge in designing Internet applications that both enhance your operational model, and address the users needs .

With many other Register of Deeds web applications, end users can't view document images unless they download a separate program to run on their PC. This prevents users from being able to visit the site for the first time and quickly find what they need. Customer service is critical, and you'll be pleased to find the system places that as the priority.

Another key distinction that differentiates Inttek's system from the competition is its ultra-fast search technology. This allows "blink of an eye" search response times, even on millions and millions of records. As Register of Deeds begin to enter historical data, the sheer size of the data becomes an issue. This is particularly true for larger municipalities, or counties that wish to put records online going back over fifty-plus years. Inttek's system uses technology similar to that of the major search engines. What this means for the end user is lightning fast response times. For the system administrators this efficiency means being able to use significantly less expensive hardware, ultimately translating into saving Taxpayers dollars.

Inttek project management experts work with Register of Deeds and MIS Personnel to tailor a system that best fits both the legal requirements and workflow of your Register of Deeds Office. Installations are designed to work as an extension of your core functionality. The final result is significant improvement in customer service, lower operational costs, improved administration and - satisfied end users.

is scalable to millions and millions of records, while maintaining "blink of an eye" response times.

- Wide range of installation solutions, ranging from partial to turnkey systems. All installations are designed "looking ahead" so system upgrade and scaling is always an option. Options are available for hosting remotely, or onsite at your Office.
- Inttek Offices in multiple NC counties – onsite technical support is in State and usually a short drive away.
- Competitive pricing - flexible payment options - and working with a local NC Company. This combination makes it an excellent investment for North Carolina Taxpayers.

The system can be run on multiple Operating systems, but is optimized to run on Red Hat Linux. The result is lower Taxpayer costs, mission critical reliability, and access to the most advanced technologies available. Inttek's application of the best of open source technologies also helps reduce overall system cost.

Internet Technologies, Inc. is a NC founded and based corporation, with offices in New Hanover and Brunswick Counties. This means hard-earned Taxpayer funds used to implement the system stay in North Carolina.
